ABSTRACT

The graduation project is one of the most important requirements in a student's final academic year. Managing this project can be difficult due to poor organization, scattered communication, and the absence of a unified system that brings all related activities together. In many cases, students and supervisors rely on different tools to exchange information, submit work, and track progress, which often leads to confusion, delays, and missing data.

This project presents a web-based platform designed to manage graduation projects in an organized and efficient way. The system allows students to submit their work, receive feedback, and track their progress, while supervisors can assign tasks, monitor project development, and communicate directly with students. Coordinators and examiners are also supported through clear role-based access and structured workflows.

The platform provides features such as project registration, task management, file submissions, notifications, progress tracking, an archive of previous projects, and electronic evaluation for final defenses. By using this system, graduation project management becomes more organized, transparent, and easier for all users involved.

الملخص

يُعتبر مشروع التخرج من أهم متطلبات السنة الدراسية الأخيرة للطلاب. إلا أن إدارة هذا المشروع قد تكون صعبة بسبب ضعف التنظيم، وتشتت وسائل التواصل، وعدم وجود نظام موحد يجمع جميع الأنشطة المتعلقة بمشاريع التخرج.

في كثير من الحالات، يعتمد الطلبة والمشرفون على أدوات مختلفة لتبادل المعلومات وتسليم الأعمال ومتابعة التقدم، مما يؤدي إلى الارتباك والتأخير وضياع بعض البيانات.

يقدم هذا المشروع منصة إلكترونية تعتمد على الويب لإدارة مشاريع التخرج بطريقة منظمة وفعالة. تتيح المنصة للطلبة تسجيل مشاريعهم، وتسليم الملفات، واستلام الملاحظات، ومتابعة تقدمهم، بينما تمكن المشرفين من توزيع المهام، ومراقبة سير العمل، والتواصل المباشر مع الطلبة. كما تدعم المنصة المنسقين والممتحنين من خلال نظام صلاحيات واضح وإجراءات منظمة.

توفر المنصة خصائص مثل تسجيل المشاريع، وإدارة المهام، وتسليم الملفات، ونظام إشعارات، ومتابعة التقدم، وأرشيف لمشاريع التخرج السابقة، ونظام تقييم إلكتروني لمناقشات المشاريع النهائية. ويساهم هذا النظام في تحسين تنظيم ووضوح وكفاءة إدارة مشاريع التخرج لجميع الأطراف المعنية.

CHAPTER 1

INTRODUCTION

1.1 Overview

In the current digital era, the Internet and web-based systems have become essential tools for efficiently and securely supporting a wide range of academic and administrative activities. This rapid technological advancement has encouraged universities to adopt online platforms in order to enhance the management of educational processes. Within this context, the development of a web-based Graduation Projects Management System has emerged as a necessary solution to support the effective organization and supervision of graduation projects.

Graduation projects represent a core academic requirement across different faculties within universities, as they allow students to apply theoretical knowledge and practical skills to real-world problems. With the continuous increase in the number of students and the involvement of multiple stakeholder such as students, supervisors, examiners, and academic coordinators, the management of graduation projects has become a complex process that requires effective organization and continuous monitoring.

Despite their importance, many universities still rely on traditional methods or non-specialized systems to manage graduation projects, which often result in poor coordination, limited progress tracking, and inconsistent evaluation practices. Therefore, there is a clear need for an integrated electronic system that manages all stages of the graduation project lifecycle within a single unified platform.

1.2 Problem Statement and Research Question

➤ Problem Statement:

The management of graduation projects faces several key challenges, including the lack of a centralized system for tracking project progress, difficulties in coordination among

stakeholders, and the absence of structured mechanisms for evaluation and thesis version control. These challenges lead to increased administrative workload, reduced transparency, and difficulties in effectively monitoring students' progress.

➤ **Research Questions:**

Based on these challenges, this project seeks to answer the following research question:

How can an integrated web-based system be designed to improve the organization, monitoring, evaluation, and overall management of graduation projects across different faculties within universities?

1.3 General Objective

The general objective of this project is to design and develop an effective, easy-to-use, and integrated electronic system for managing graduation projects across different faculties within universities, with the aim of improving organization, monitoring, evaluation, and documentation throughout all stages of the graduation project lifecycle.

1.4 Objectives

- Provide a centralized platform for graduation project management.
- Enable students to track tasks, submissions, and overall project progress.
- Support supervisors and examiners with structured and transparent evaluation tools.
- Assist academic coordinators in managing timelines, and evaluation forms.
- Improve communication and coordination among all stakeholders involved in graduation projects.
- Provide automated support to assist students with common inquiries related to graduation projects.

1.5 Scope of Work

The scope of this project includes the design and development of a web-based Graduation Projects Management System intended to support graduation projects across different faculties within the university. The system is designed to serve students, supervisors, examiners, and academic coordinators by providing tools for project group management, task and submission tracking, document and thesis version control, evaluation processes, timeline management, and final grading.

The system is built to be flexible and scalable, allowing it to be adapted to the specific requirements of various faculties. However, the project does not cover financial systems, admission systems, or other academic services that are not directly related to graduation project management.

1.6 Importance of the Research

The scope of this project includes the design and development of a web-based Graduation Projects Management System that serves students, supervisors, examiners, and academic coordinators across different faculties. The system covers project group management, task and submission tracking, document and thesis version control, evaluation processes, timeline management, and final grading.

The system is designed to be flexible and scalable to accommodate faculty-specific requirements. However, systems related to financial management, student admissions, or other unrelated academic services are outside the scope of this project.

CHAPTER 2

LITERATURE REVIEW

2.1 Introduction

Universities face major challenges in managing graduation projects because many stakeholders are involved (students, supervisors, examiners, and administrators) and the workflow includes multiple stages such as project registration, supervision follow-up, submissions, evaluation, and archiving. In many cases, universities rely on separate tools or manual procedures, which can waste time, weaken communication, and make it difficult to track project progress accurately.

This literature review discusses graduation project management systems implemented in different universities, highlighting their main strengths, weaknesses, and the gaps that still remain. Based on these findings, the proposed Graduation Project Management Platform **(GPM Platform)** at Palestine Technical University – Kadoorie **(PTUK)** aims to provide an integrated digital platform that improves collaboration among all parties and supports close monitoring of each stage, from proposal submission to final evaluation. The system also includes a structured archive to support searching, reviewing, and analyzing previous projects.

2.2 Comparison of Existing Systems and the Proposed GPMS

This section reviews selected graduation project management systems to identify what each system covered and what it missed, focusing on documentation, communication, progress tracking, teamwork support, examiner management, and evaluation.

- **Princess Nourah University (2015)** emphasized organizing documents, templates, and workflow stages, which helped provide clear guidance for students. However, it did not provide strong tools for direct communication, structured evaluation, or teamwork support.[1]

- **University of Petra (2017)** supported project submission, evaluation, progress tracking, and communication. However, it provided limited support for idea development, teamwork management, and examiner/defense management.[2]

Overall, these systems contributed useful features, but each one focused on specific parts of the process rather than providing full end-to-end management.

In addition to reviewing previous systems, this section also includes the proposed GPM Platform at PTUK as a reference point for comparison. Unlike the reviewed platforms that focus on specific components (such as documentation, communication, or basic evaluation), the proposed GPM Platform is designed as an end-to-end platform that integrates the full graduation project lifecycle, including team and idea management, supervisor and examiner assignment, multi-stage evaluation, structured communication, automated notifications, progress tracking, and archiving with advanced search and reporting.

2.3 Gaps in the Literature

Although many universities have developed systems to improve documentation, evaluation, and communication, several gaps remain:

- **Lack of integration:** Most systems focus on one area (documents, evaluation, or communication) rather than managing the full project lifecycle.
- **Limited teamwork support:** Many platforms do not support team creation, task distribution, and clear monitoring of group projects.
- **Weak examiner and defense management:** Assigning examiners and scheduling defenses are often not supported or not automated.
- **Limited automation and notifications:** Some systems provide simple reminders, but lack organized and role-based notifications linked to milestones and tasks.

- **Limited flexibility in evaluation and reporting:** Evaluation forms and reports are often fixed and cannot be easily customized for different departments or policies.

2.4 How the Proposed GPM Platform Improves Project Management

The proposed (GPM Platform) at PTUK addresses the above gaps by providing a comprehensive and integrated platform with the following contributions:

- **Full integration:** Managing the complete process (proposal → supervision → submissions → evaluation → archiving) within one system.
- **Teamwork support:** Allowing team formation, task assignment, and clear monitoring for group projects.
- **Examiner and defense management:** Supporting examiner assignment and organizing defense schedules through the platform.
- **Multi-stage evaluation:** Providing flexible evaluation forms for supervisors and examiners to ensure structured and fair assessment.
- **Automation and notifications:** Role-based notifications and reminders to improve follow-up and reduce missed tasks.
- **Performance tracking and reporting:** Collecting project data across stages to generate useful reports for monitoring and decision-making.
- **Improved communication:** Offering organized communication features that reduce loss of information and support continuous guidance.

CHAPTER 3

METHODOLOGY

3.1 Methodology

Following the literature review, this section describes the research design and methodology adopted to develop the **Graduation Projects Management System**. The main objective of this research is to design and implement an efficient web-based system that facilitates the management of graduation projects and improves communication between students, supervisors, and department heads.

3.1.1 Research Design

This research follows an applied and developmental research design, as it focuses on designing and developing a real-world software system to solve an existing problem in academic project management. The system aims to provide an organized platform for managing graduation projects, tracking tasks, and enhancing collaboration.

3.1.2 Research Methodology

The research methodology is based on a system development approach that combines **analysis, design, implementation, and testing**. The following steps were followed:

3.1.2.1 Requirements Analysis

Requirements were collected by analyzing existing graduation project management processes and reviewing related literature. Functional and non-functional requirements were identified to define system features and constraints.

3.1.2.2 System Design

The system architecture was designed by defining the front-end, back-end, and database structure. User roles and system workflows were clearly identified to ensure smooth interaction between system components.

3.1.2.3 System Implementation

The system is planned to be implemented using modern web technologies. The front-end will be developed using **HTML**, **CSS**, **JavaScript**, **Bootstrap**, and **React.js**, while the back-end will be implemented using **ASP.NET**. In addition, **SQL** Server will be used for storing and managing the system data.

3.1.2.4 System Testing

Comprehensive testing of the system will be conducted in the later stages of the project after the completion of the development process. This testing aims to ensure the correctness, efficiency, and security of the system's functionalities. The testing process will verify all core features, including user authentication, project management, user communication, and task submission.

In addition, the Postman tool will be used to test the system's APIs and to ensure smooth and reliable communication between the front-end and back-end interfaces.

3.1.2.5 System Evaluation

After the system implementation is completed, the system will be evaluated based on several criteria, including usability, performance, and the extent to which it achieves the proposed

objectives. User feedback, such as observations from students and supervisors, will also be considered to enhance the system and ensure its alignment with their academic needs.

3.1.3 Research Methods Used

The research employs the following methods:

1. **System modeling** to design system structure and workflows.
2. **Case study approach**, as the system is applied to a university graduation project management scenario.
3. **Literature review** to support design decisions and identify best practices.

3.2 Technologies

3.2.1 Front-End Technologies

3.3.1.1 HTML

HTML is used to structure the web pages of the system. It defines the basic layout and elements such as forms, buttons, tables, and content sections displayed to users.

Figure1 : HTML Logo

3.2.1.2 CSS

CSS is responsible for styling the user interface. It controls colors, fonts, layouts, and responsiveness to ensure a visually appealing and user-friendly design across different devices.

Figure2 : CSS Logo

3.2.1.3 JavaScript

JavaScript is used to add interactivity and dynamic behavior to the system, such as form validation, handling user actions, and updating page content without reloading.

Figure3 : JavaScript Logo

3.2.1.4 Bootstrap

Bootstrap is a front-end framework used to build responsive and consistent user interfaces. It provides ready-made components like navigation bars, modals, and grids, reducing development time.

3.2.1.5 React.js

React.js is a JavaScript library used to build interactive and efficient user interfaces. It enables component-based development and allows fast updates to the user interface without refreshing the page.

Figure 4: React Logo

3.2.2 Backend Technology

3.2.2.1 ASP.NET

ASP.NET is used to develop the server-side of the system. It handles business logic, user authentication, data processing, and communication between the front-end and the database. ASP.NET provides high performance, security, and scalability for web applications.

Figure 5: .NET Core Logo

3.2.3 Database Technology

3.2.3.1 SQL Server

SQL Server is used to store and manage system data such as students, supervisors, graduation projects, tasks, and submissions. It ensures data integrity, security, and efficient data retrieval.

Figure6 : Microsoft SQL Server Management Studio

3.2.4 Development and Testing Tools

3.2.4.1 Visual Studio

Visual Studio is used for developing and managing the ASP.NET back-end. It provides powerful debugging and project management tools.

Figure 7: Visual Studio Logo

3.2.4.2 Visual Studio Code

VS Code is used for front-end development using HTML, CSS, JavaScript, and React.js. It offers flexibility, extensions, and fast editing features.

Figure8 : VS Code Logo

3.2.4.3 Git

Git is a version control system used to track changes in the project source code and manage collaborative development.

3.2.4.4 GitHub

GitHub is used to host the project repository, enabling team collaboration, code sharing, and version management.[9]

Figure 9: Git & GitHub Logo

3.2.4.5 Postman

Postman is used to test and verify API endpoints, ensuring correct communication between the front-end and back-end.[8]

Figure10 : Postman Logo

CHAPTER 4

IMPLICATIONS AND CONTRIBUTION TO KNOWLEDGE

4.1 Improving processes in specific location or feiled

The proposed GPM Platform is expected to significantly improve the management of graduation projects within academic departments by providing a centralized and well-structured environment for handling project-related data. The system enhances organization, minimizes information loss, and supports the continuity of academic knowledge across different academic years.

Graduation projects and thesis documents are preserved within a unified database, ensuring long-term availability and traceability. Each project is associated with a specific student group and stored through dedicated entities, which improves data consistency and retrieval efficiency.

4.2 Informing Policy Objectives

The proposed system supports institutional and departmental policy objectives by providing flexibility in applying academic regulations and evaluation procedures. It allows universities and faculties to update policies efficiently without affecting the overall system structure.

In addition, the system supports dynamic evaluation forms that can be modified each academic semester based on university or faculty decisions. This enables administrators to adjust evaluation criteria, grading scales, and assessment components without the need for system redesign.

4.3 Strengthening a theory or model

This research contributes to strengthening existing academic management models by proposing an integrated data model that supports the full lifecycle of graduation projects. The model unifies planning, supervision, task management, evaluation, and communication within a single framework.

The proposed **ERD** illustrates the relationships between academic roles and processes. For instance, students are organized through the **ProjectGroup** entity, supervised by academic staff represented in the **Supervisor** entity, and guided through structured tasks stored in the **Task** entity. This integrated design enhances data-driven academic management and supports systematic project workflows.

4.4 Challenging Popular or Scientific Assumptions

The proposed system challenges the common assumption that graduation project management can be effectively handled using manual processes or isolated digital tools. Instead, it highlights the necessity of an integrated and centralized system to ensure transparency, accountability, and effective communication among all stakeholders.

4.5 Creating a Basis for Further Research

This research provides a solid foundation for future studies by introducing a structured and extensible data model for graduation project management. The organized and accumulated data generated by the system can support future analysis, evaluation, and system enhancement research.
